STOCK PRICE PREDICTOR

U23AM491-MACHINE LEARNING PROJECT REPORT

SUBMITTED IN PARTIAL FULFILLMENT OF THE REQUIREMENTS FOR THE AWARD OF THE

DEGREE OF **BACHELOR OF ENGINEERING**

IN **CSE (ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING)**

OF THE ANNA UNIVERSITY

U23AM491-

MACHINE LEARNING PROJECT

APRIL/MAY 2026

PROJECT WORK

BATCH

2024 - 2028

SUBMITTED BY

KUBOJA DANIEL M - 722824148050

UNDER THE GUIDANCE OF

Ms.S.Sindhuja,

ASSISTANT PROFESSOR

DEPARTMENT OF CSE (ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING)

Sri Eshwar College of Engineering

(An Autonomous Institution)

Kinathukadavu (Tk), Coimbatore - 641 202, Tamil Nadu

Approved by AICTE, New Delhi and Affiliated to Anna University, Chennai

BONAFIDE CERTIFICATE

Certified that this Report titled **"STOCK PRICE PREDICTOR"** is the bonafide work of

KUBOJA DANIEL M **722824148050**

who carried out the project work under my supervision.

QUALITY POLICY

To establish a system of Quality Enhancement, which would on a continuous basis evaluate and enhance the quality of teaching – learning, research and extension activities of the institution, leading to improvements in all processes, enabling the institution to attain excellence.

INSTITUTION VISION

To be recognized as a premier institution, grooming students into globally acknowledged engineering professionals.

INSTITUTION MISSION

1. Providing outcome and value-based engineering education
2. Nurturing research and entrepreneurial culture
3. Enabling students to be industry ready and fulfil their career aspirations
4. Grooming students through behavioural and leadership training programs
5. Making students socially responsible

DEPARTMENT OF CSE (ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING)

DEPARTMENT VISION

To become a model hub for Computer Science and Engineering-Artificial Intelligence and Machine Learning education and research by acquiring, disseminating, and generating knowledge in order to meet societal demands.

DEPARTMENT MISSION

1. Evolve curriculum and delivery approaches to provide broad and wide exposure to the learner to gain adequate knowledge in their field of study.

2. Provide opportunities for faculties to enhance their domain knowledge and skills required for the programs offered.
3. Establish connections with local, national and global experts to share, utilize and exchange domain expertise.
4. Conduct Outreach activities for the society that involve the use of artificial intelligence and machine learning solutions to deal with societal issues.

PROGRAM EDUCATIONAL OBJECTIVES

PEO1: Graduates will have successful careers in AI and ML-related fields, including positions such as data scientists, machine learning engineers, AI researchers, and consultants.

PEO2: Graduates will recognize the dynamic nature of AI and ML technologies and engage in continuous learning to stay abreast of the latest advancements, tools, and techniques in the field.

PEO3: Graduates will have the knowledge and skills to identify opportunities for applying AI and ML in various domains, potentially founding startups, or contributing to the growth and competitiveness of existing organizations.

PROGRAM OUTCOMES

PO1: Engineering Knowledge: Apply knowledge of mathematics, natural science, computing, engineering fundamentals and an engineering specialization as specified in WK1 to WK4 respectively to develop to the solution of complex engineering problems.

PO2: Problem Analysis: Identify, formulate, review research literature and analyze complex engineering problems reaching substantiated conclusions with consideration for sustainable development. (WK1 to WK4)

PO3: Design/Development of Solutions: Design creative solutions for complex engineering problems and design/develop systems/components/processes to meet identified needs with consideration for the public health and safety, whole-life cost, net zero carbon, culture, society and environment as required. (WK5)

PO4: Conduct Investigations of Complex Problems: Conduct investigations of complex engineering problems using research-based knowledge including design of experiments, modelling, analysis & interpretation of data to provide valid conclusions. (WK8).

PO5: Engineering Tool Usage: Create, select and apply appropriate techniques, resources and modern engineering & IT tools, including prediction and modelling recognizing their limitations to solve complex engineering problems. (WK2 and WK6)

PO6: The Engineer and The World: Analyze and evaluate societal and environmental aspects while solving complex engineering problems for its impact on sustainability with reference to economy, health, safety, legal framework, culture and environment. (WK1, WK5, and WK7).

PO7: Ethics: Apply ethical principles and commit to professional ethics, human values, diversity and inclusion; adhere to national & international laws. (WK9)

PO8: Individual and Collaborative Team work: Function effectively as an individual, and as a member or leader in diverse/multi-disciplinary teams.

PO9: Communication: Communicate effectively and inclusively within the engineering community and society at large, such as being able to comprehend and write effective reports and design documentation, make effective presentations considering cultural, language, and learning differences

PO10: Project Management and Finance: Apply knowledge and understanding of engineering management principles and economic decision-making and apply these to one's own work, as a member and leader in a team, and to manage projects and in multidisciplinary environments.

PO11: Life-Long Learning: Recognize the need for, and have the preparation and ability for i) independent and life-long learning ii) adaptability to new and emerging technologies and iii) critical thinking in the broadest context of technological change. (WK8)

PROGRAM SPECIFIC OUTCOMES

PSO1: Apply Artificial Intelligence and Machine Learning techniques to design systems that support informed decision-making through data analysis and pattern recognition.

PSO2: Integrate machine learning, deep learning, computer vision, and natural language processing with modern tools to develop effective solutions for complex data interpretation tasks.

ACKNOWLEDGEMENT

We thank God for his grace and blessing that have been showered upon us to bring success for this project. The success we have accomplished in our project would not have been possible without the timely help and guidance rendered to us by many people. We take this opportunity to thank them all.

We wish to express our deep gratitude **Mr. R. Mohanram**, Chairman, Sri Eshwar College of Engineering, Kondampatti for being kindly permitted us to carry on the project. He has an abiding interest in our wellbeing.

We are grateful to **Dr. Sudha Mohanram M.E., Ph.D** Principal, Sri Eshwar College of Engineering, Kondampatti for having made all provision available to us.

We are thankful to **Mr. R. Rajaram**, Director, Sri Eshwar College of Engineering, Kondampatti for all his support to complete the project effectively.

We would like to express our heartfelt gratitude and humble thanks to Head of the Department **Dr. S.Sumathi M.E., Ph.D** for having facilitated us to complete the project successfully.

With the deep sense of gratitude, we extend our earnest and sincere thanks to our project guide **Ms.S.Sindhuja M.E., (Ph.D),** Assistant Professor, Department of CSE (Artificial Intelligence and Machine Learning), for her kind suggestion and co-operation for doing the project. Finally, we would like to extend our thanks to our teaching and non-teaching staffs those who helped us in bringing out project successfully.

ABSTRACT

Financial markets are characterized by high volatility and non-linear patterns, making traditional technical analysis often insufficient for consistent alpha generation. This project, titled "ML-Based Stock Market Price Predictor," presents a production-grade algorithmic framework designed to predict market direction and manage portfolios using advanced machine learning techniques. The system integrates historical **OHLCV** data from **Yahoo Finance** with macroeconomic indicators from **FRED** to construct a robust dataset of over 50 stationary, ratio-based features, including momentum, volatility regimes, and technical oscillators. To ensure high-quality predictive modeling, the system employs an **XGBoost** classifier optimized via **Optuna hyperparameter tuning** and refined through Isotonic probability calibration to produce reliable confidence scores. A critical component of the methodology is the use of expanding-window walk-forward evaluation across five folds, which mitigates look-ahead bias and provides an honest assessment of model performance in shifting market regimes. The trading logic incorporates a long-only strategy with per-ticker optimal probability thresholds and realistic transaction cost simulations to bridge the gap between theoretical accuracy and practical profitability. Performance metrics, including the *Sharpe Ratio*, *Sortino Ratio*, and *Maximum Drawdown*, demonstrate that while market noise remains a challenge, the model successfully captures strong trend-following signals, particularly evidenced by a 251% return on **NVDA** during bullish periods. The end-to-end solution is delivered through an interactive **Streamlit** dashboard that facilitates live paper trading, portfolio tracking, and detailed strategy analytics. Ultimately, this project demonstrates the efficacy of combining feature engineering, calibrated machine learning, and rigorous backtesting to create a disciplined, data-driven approach to modern equity trading.

CHAPTER 1
INTRODUCTION

1.1 OBJECTIVES

The primary objective of this project is to develop a production-grade algorithmic trading system that leverages hybrid machine learning models to predict stock market movements. By synthesizing historical price data (OHLCV) with fundamental macroeconomic indicators such as CPI and Treasury Yields, the system provides real-time "Buy/Hold/Sell" signals through an intuitive web interface. The goal is to minimize the emotional biases inherent in manual trading by offering a disciplined, data-driven framework for portfolio management. Key technical objectives include:

- **Hybrid Modeling**: Implementing a stacking ensemble that combines LSTM networks (for temporal dependencies) and XGBoost (for non-linear tabular patterns).
- **Risk Management**: Developing a probability-calibrated engine that assesses the confidence of every trade signal.
- **Backtesting Integrity**: Building a simulation environment that accounts for slippage and transaction costs to ensure realistic performance evaluations.
- **Accessibility**: Providing a centralized Streamlit dashboard for multi-asset tracking and paper trading.

1.2 SCOPE OF THE PROJECT

This project encompasses the full lifecycle of an algorithmic trading pipeline, from automated data ingestion to live simulation. It covers:

- **Data Pipeline**: Automated fetching and local caching of market data from Yahoo Finance and macro data from FRED.

- **Feature Engineering**: The construction of over 50 stationary, ratio-based indicators to ensure the model remains robust across different price levels.
- **Model Optimization**: Utilizing Optuna for Bayesian hyperparameter tuning and Isotonic regression for probability calibration.
- **Validation**: Implementing a 5-fold expanding-window walk-forward validation strategy to simulate real-world "unseen" data scenarios.
- **Deployment**: A responsive Streamlit-based web environment for monitoring equity curves, drawdowns, and trade history.

The project serves as a foundational tool for quantitative research, designed to be scalable for future integrations with live brokerage APIs and sentiment analysis modules.

CHAPTER 2

SYSTEM ANALYSIS AND SPECIFICATION

2.1 PROBLEM DESCRIPTION

Financial markets are highly dynamic, characterized by non-linear price movements and high levels of noise. Traditional investment strategies often rely on static technical indicators or manual analysis, which struggle to account for the complex interplay between historical price patterns, volatility regimes, and macroeconomic shifts. For individual investors and institutional traders alike, the inability to process vast amounts of multi-dimensional data in real-time leads to sub-optimal entry and exit points, increased risk exposure, and missed opportunities for alpha generation.

There is a critical need for an automated, data-driven system that can synthesize technical, momentum, and macroeconomic data into actionable trading signals. Such a system must not only predict direction but also provide reliable confidence scores to manage risk effectively.

This project addresses this challenge by developing the “ML-Based Stock Trading System.” By leveraging a hybrid ensemble architecture—combining the sequential learning capabilities of

Long Short-Term Memory (LSTM) networks with the gradient-boosted decision trees of XGBoost—the system aims to identify profitable trading regimes. Through a user-friendly Streamlit interface, it provides real-time predictions and portfolio management tools, bridging the gap between complex machine learning research and practical trading execution.

2.2 FUNCTIONAL REQUIREMENT

1. **Data Acquisition & Integration**: Automatically download historical OHLCV data from Yahoo Finance and integrate macroeconomic indicators (CPI, Treasury Yields) from FRED.
2. **Stationary Feature Engineering**: Transform raw price data into stationary, ratio-based features (e.g., SMA ratios, RSI, Ichimoku Cloud differences) to ensure model stability.
3. **Hybrid Model Inference**: Utilize a stacking ensemble (LSTM for temporal patterns, XGBoost/Random Forest for tabular features) to generate direction signals.
4. **Probability Calibration**: Apply Isotonic calibration to raw model outputs to provide reliable "confidence" scores for buy/sell signals.
5. **Backtesting Engine**: Simulate historical performance including realistic 0.1% transaction costs and long-only strategy logic.
6. **Interactive Dashboard**: A Streamlit-based UI for multi-asset selection, threshold adjustment, and live equity curve visualization.
7. **Automated Walk-Forward Validation**: Implement expanding-window validation to assess model robustness across different historical market regimes.
8. **Portfolio Management**: Track active positions, entry prices, and total equity in a simulated paper-trading environment.

Software Requirements:

1. **Frontend**: Streamlit, Plotly (for interactive charting).
2. **Backend**: Python 3.9+, Flask (for API services if applicable)

3. **Machine Learning**: XGBoost, Scikit-Learn, TensorFlow/Keras (for LSTM), Optuna (for hyperparameter tuning.
4. **Data Handling**: Pandas, NumPy, YFinance, Pandas_datareader.

5. **Environment**: Virtualenv, Git, VS Code.

Hardware Requirements:

1. **Client/Developer**: Quad-core CPU (Intel i5/i7 or Apple M-Series), 16GB RAM (for model training), SSD storage.
2. **Internet**: High-speed connection required for real-time data fetching from Yahoo Finance and FRED APIs.

2.3 NON-FUNCTIONAL REQUIREMENT

2.3.1 Performance

• Feature engineering and model inference for a single ticker should complete within 5 seconds

2.3.2 Scalability

• The modular architecture should allow for adding new tickers or macro features without restructuring the core pipeline.

2.3.3 Usability

• The dashboard must present complex metrics (Sharpe Ratio, Drawdown) in a visually intuitive manner suitable for non-data scientists.

2.3.4 Reliability

• The system must handle API rate limits or missing data points gracefully using interpolation or cached backups.

2.3.5 Transparency

• The system should display feature importance scores to explain why certain signals are generated.

2.4 SWOT ANALYSIS

Strengths	Weaknesses
Hybrid architecture captures both temporal and tabular patterns.	High sensitivity to "regime shifts" where historical patterns break.
Comprehensive stationary feature set (50+ indicators).	Low signal-to-noise ratio in daily financial data.
Rigorous walk-forward validation prevents overfit.	High computational cost for hyperparameter tuning.

Opportunities	Threats
Integration with live brokerage APIs for auto-trading.	Market volatility spikes (Black Swan events) exceeding model training bounds.
Adding Sentiment Analysis from news/social media.	Potential for "look-ahead bias" if data leakage occurs in preprocessing
Expanding to Crypto or Forex markets.	Changes in API access policies (Yahoo Finance/FRED).

2.5 FEASIBILITY STUDY

Technical Feasibility

• The use of established libraries like XGBoost and TensorFlow ensures that the hybrid model is implementable.

• The stacking pipeline has already demonstrated the ability to process tickers like AAPL and NVDA with valid AUC results.

Economic Feasibility

• The project relies entirely on open-source libraries and free data APIs, making the operational cost negligible for research and individual use.

Operational Feasibility

• The Streamlit interface abstracts the underlying complexity, making the system operational for users who understand trading basics but lack machine learning expertise.

CHAPTER 3

SYSTEM DESIGN

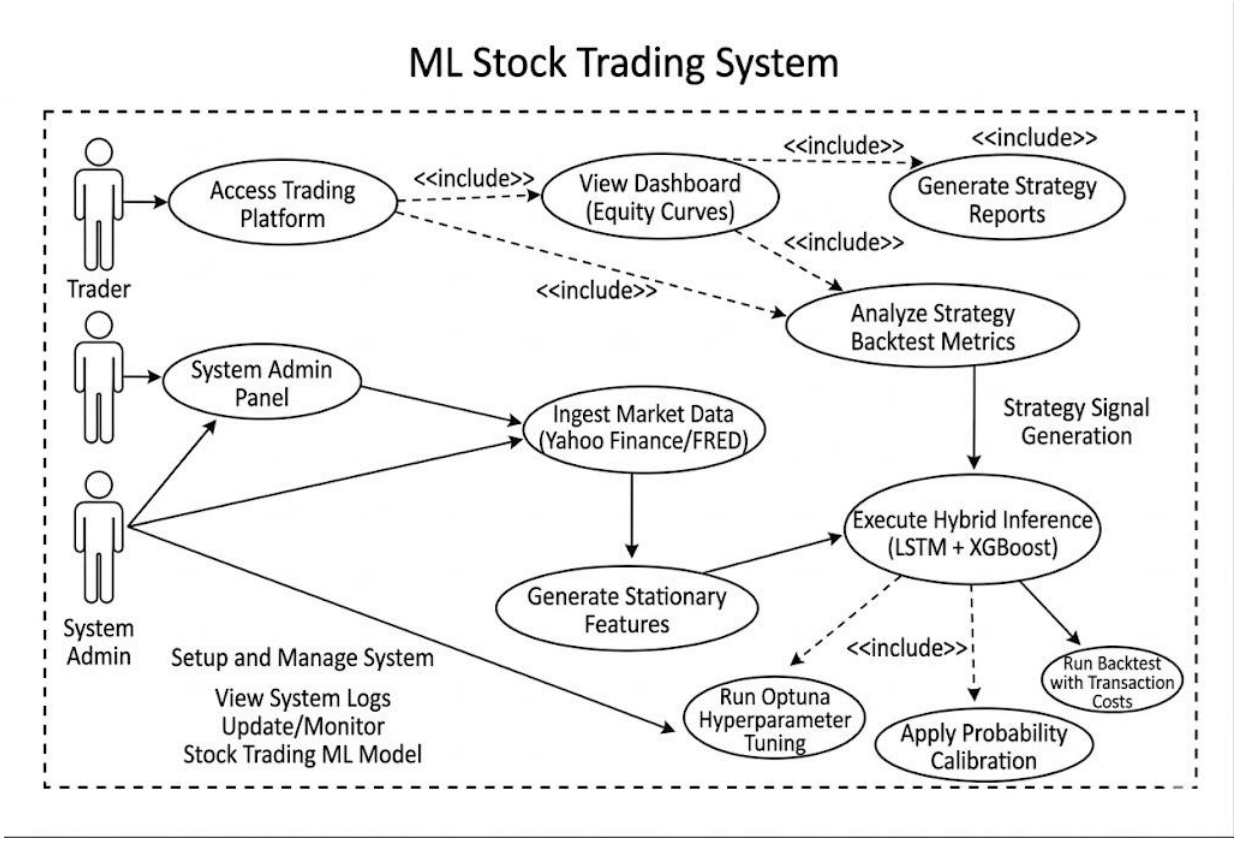

FIG 1: USECASE DIAGRAM

3.2 CLASS DIAGRAM

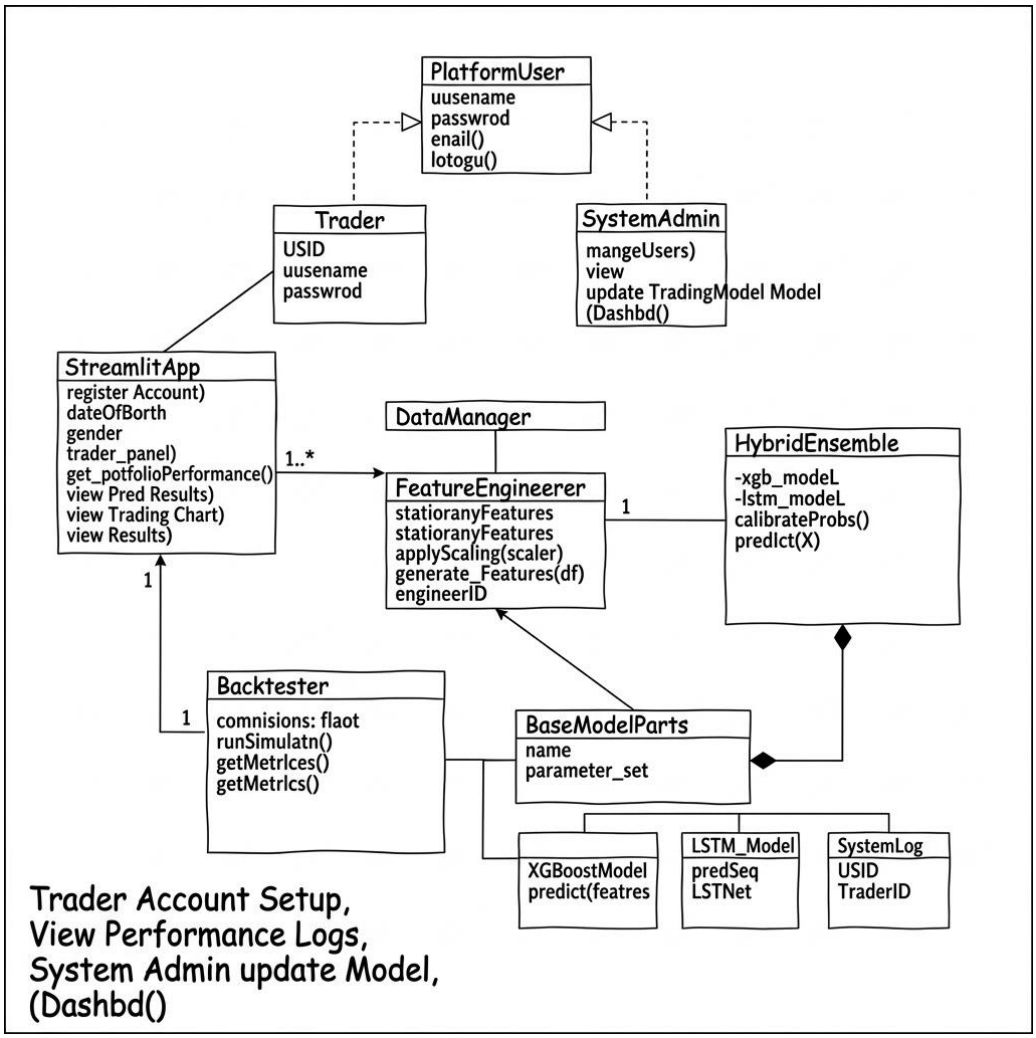

FIG 2: CLASS DIAGRAM

CHAPTER 4

PROJECT DESCRIPTION

4.1 System Overview

The ML-Based Stock Trading System is an integrated quantitative platform built using Python and Streamlit. Unlike traditional static models, this system employs a **Hybrid Stacking Pipeline** that merges the strengths of deep learning and gradient boosting. The architecture is designed to handle the high noise-to-signal ratio of financial markets by transforming raw prices into stationary features and using a meta-learner to aggregate predictions from multiple base models. The system offers a unified interface for:

- **Multi-Asset Analysis**: Simultaneous tracking of high-growth tickers (AAPL, NVDA, MSFT, GOOGL).
- **Signal Generation**: Real-time classification of market direction (Up/Down) over a 21-day horizon.
- **Portfolio Simulation**: Tracking virtual equity, position sizes, and cumulative returns.
- **Visual Analytics**: Interactive Plotly charts for ROC curves, confusion matrices, and equity growth vs. Market Buy-and-Hold.

4.2 Module Description

4.2.1 Data Acquisition Module

Description:
Handles the retrieval of external data.

Functionality:

- Downloads daily OHLCV data via yfinance.
- Fetches macroeconomic data (CPI, Unemployment, Rates) via pandas_datareader.
- Caches data locally in CSV format to reduce API overhead.

4.2.2 Stationary Feature Engineering Module

Description:
Transforms raw non-stationary price data into features suitable for ML.

Functionality:

- Computes returns (1d to 21d), volatility regimes, and momentum ratios.

- Generates technical indicators: MACD, RSI, Bollinger Bands, Ichimoku Cloud, and ADX.
- Normalizes volume and price-based indicators using ratio-to-SMA methods.

4.2.3 Hybrid Machine Learning Module (Core)

Description:
The predictive engine of the system.

Components:

- **Base Learners**: LSTM (for sequential patterns), XGBoost (for tabular interactions), and Random Forest.
- **Meta-Learner**: A stacked classifier that learns the optimal weighting of base
- **Calibration**: Isotonic regression ensures the output probability matches the empirical frequency of winning trades.model outputs.

4.2.4 Backtesting & Metrics Module

Description:

Evaluates the historical performance of the strategy.

Functionality:

- Calculates risk-adjusted metrics: Sharpe Ratio, Sortino Ratio, and Maximum Drawdown.
- Generates strategy vs. market equity curves.
- Applies 0.1% of transaction cost to every simulated trade.

4.2.5 Interactive Dashboard Module (Frontend)

Description:
The user interface built with Streamlit.

Functionality:

- Sidebar controls for probability thresholds and ticker selection.
- Real-time "Paper Trading" toggle to simulate current day execution.
- Dynamic display of feature importance and walk-forward AUC scores.

4.2.6 Database Management Module

Description:
Stores user data and prediction results.

Functionality:
• Stores user details
• Saves prediction history
• Uses SQLite database

4.2.7 FastAPI Integration Module (Backend)

Description:
Handles communication between frontend and machine learning model.

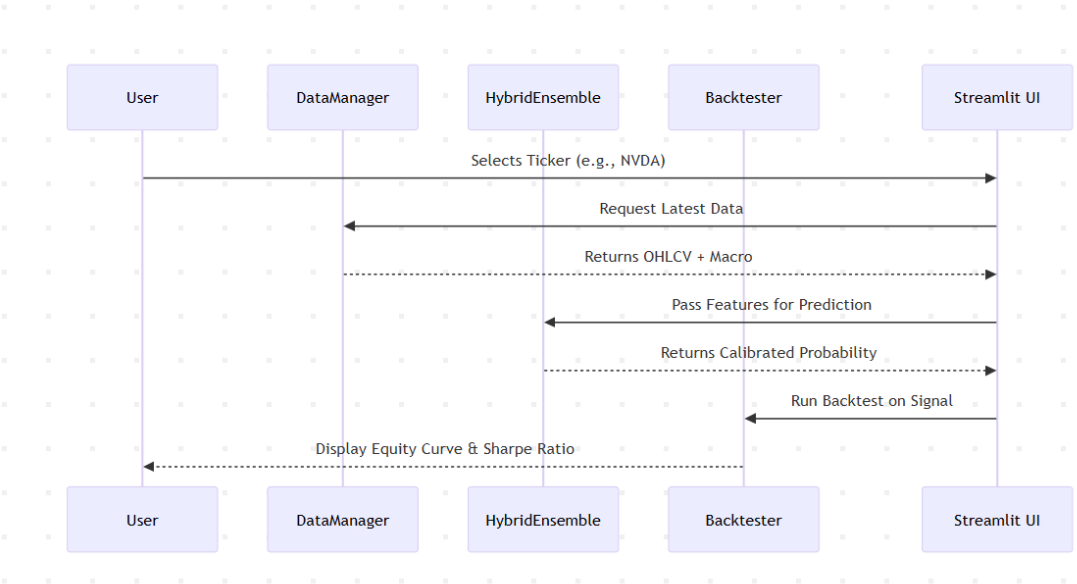
Functionality:
• Receives user input via API
• Processes data and sends prediction
• Returns results in JSON format

4.3 System Architecture

The system follows a modular **Data-Model-UI** architecture:

1. **Ingestion Layer**: Fetches raw CSV data and Macro indicators.
2. **Processing Layer**: Cleans data, handles NaNs, and engineers 50+ features.
3. **Inference Layer**: The Stacking Ensemble processes features to output a calibrated probability.
4. **Strategy Layer**: A threshold-based logic gate converts probabilities into "Buy" or "Sell" signals.
5. **Presentation Layer**: Streamlit renders the results into interactive dashboards.This architecture ensures scalability, maintainability, and efficient data flow.

4.4 Workflow Diagram (Logical View)



4.5 Benefits of The Trading System

- **Objectivity**: Eliminates "FOMO" and panic selling through rules-based execution.
- **Macro-Awareness**: Incorporates interest rates and inflation data, providing context to price movements.

- **Reduced Overfitting**: The walk-forward validation and feature selection ensure the model generalizes to new market regimes.
- **High Explainability:** Uses feature importance charts to show which indicators (e.g., RSI or CPI) are driving the current signal

Summary

This chapter detailed the internal modules and structural design of the stock predictor. By integrating deep learning with ensemble techniques, the system provides a robust framework for financial forecasting. The next chapter will focus on the specific implementation details, including the Optuna tuning process and the expansion of the hybrid stacking pipeline.

CHAPTER 5

IMPLEMENTATION

5.1 Technology Stack

Layer	Technology / Tool
Frontend	Streamlit, Plotly (Interactive Charts)
Backend/Logic	Python 3.9+ (FastAPI)
Machine Learning	XGBoost, LSTM (TensorFlow/Keras), Scikit-Learn
Hyperparameter Tuning	Optuna (Bayesian Optimization)
Data Acquisition	YFinance(YahooFinanceAPI),Pandas_datareader (FRED)
Model Storage	Joblib, TensorFlow SavedModel format
Probability Calibration	CalibratedClassifierCV (Isotonic Regression)

5.2 Application Initialization

The system initializes by loading global configurations from config.py, which defines the ticker list (AAPL, MSFT, NVDA, GOOGL) and the 21-day prediction horizon. Upon startup, the preprocessing.py script checks for cached data in the data/ directory. If the cache is stale or missing, it triggers a fresh download of OHLCV and macroeconomic data. Models and scalers are loaded from the models/ directory using joblib for immediate inference in the Streamlit dashboard.

5.3 Data Preprocessing

Unlike static medical datasets, financial data requires rigorous transformation to achieve stationarity.

Steps involved:

- **Stationarity Transformation**: Converting raw prices into returns and ratios (Price/SMA) to ensure mean-reversion in features.

- **Handling Multi-Frequency Data**: Aligning monthly macro indicators (CPI, Unemployment) with daily stock price data using forward-filling.

- **Feature Scaling**: Applying StandardScaler to normalize indicators like RSI (0-100) and Volume (millions) into a uniform range.
- **Target Labeling:** Creating a binary target (1 for Up, 0 for Down) based on the price change over the subsequent 21 trading days.

5.4 Model Training and Evaluation

The system utilizes a **Hybrid Stacking Pipeline.**

1. **Base Models**: Training XGBoost, Random Forest, and LSTM on 80% of the historical data.
2. **Optuna Tuning**: Running 50 trials per ticker to optimize hyperparameters like learning_rate, max_depth, and n_estimators for XGBoost.
3. **Calibration**: Using Isotonic Regression to map raw classifier scores to real-world probabilities.
4. **Walk-Forward Evaluation:** A 5-fold expanding window is used to test the model on successive time periods, simulating the passage of time.

5.5 Data Visualization and Analysis

The system generates several interactive HTML visualizations in the outputs/ folder to validate strategy performance.

5.5.1 Feature Importance (XGBoost)

This chart displays the top 25 features contributing to the model's decisions.

Observations: Macro features like CPI and technical levels like SMA_200 often rank highest, indicating that both long-term trends and economic health drive the 21-day predictions.

GOOGL_feature_importance.html

AAPL_feature_importance.html

MSFT_feature_importance.html

NVDA_feature_importance.html

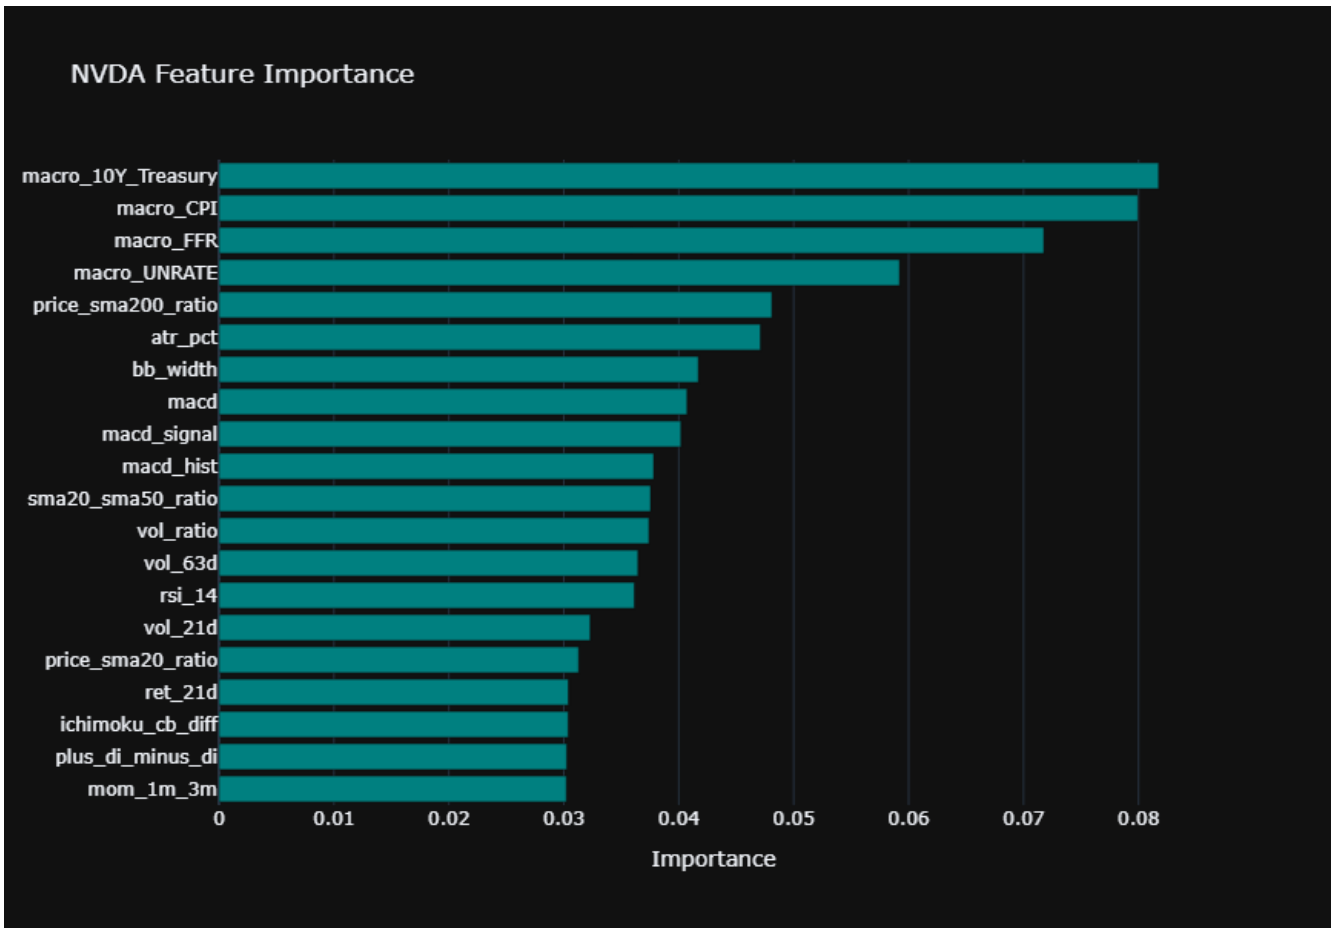


Fig 7: Feature Importance

5.5.2 ROC Curve and AUC

The ROC curve evaluates the trade-off between the True Positive Rate and False Positive Rate.

Observations: For tickers like NVDA, the AUC reflects the model's ability to distinguish between bullish and bearish regimes during volatile periods.

AAPL_roc.html

MSFT_roc.html

GOOGL_roc.html

NVDA_roc.html

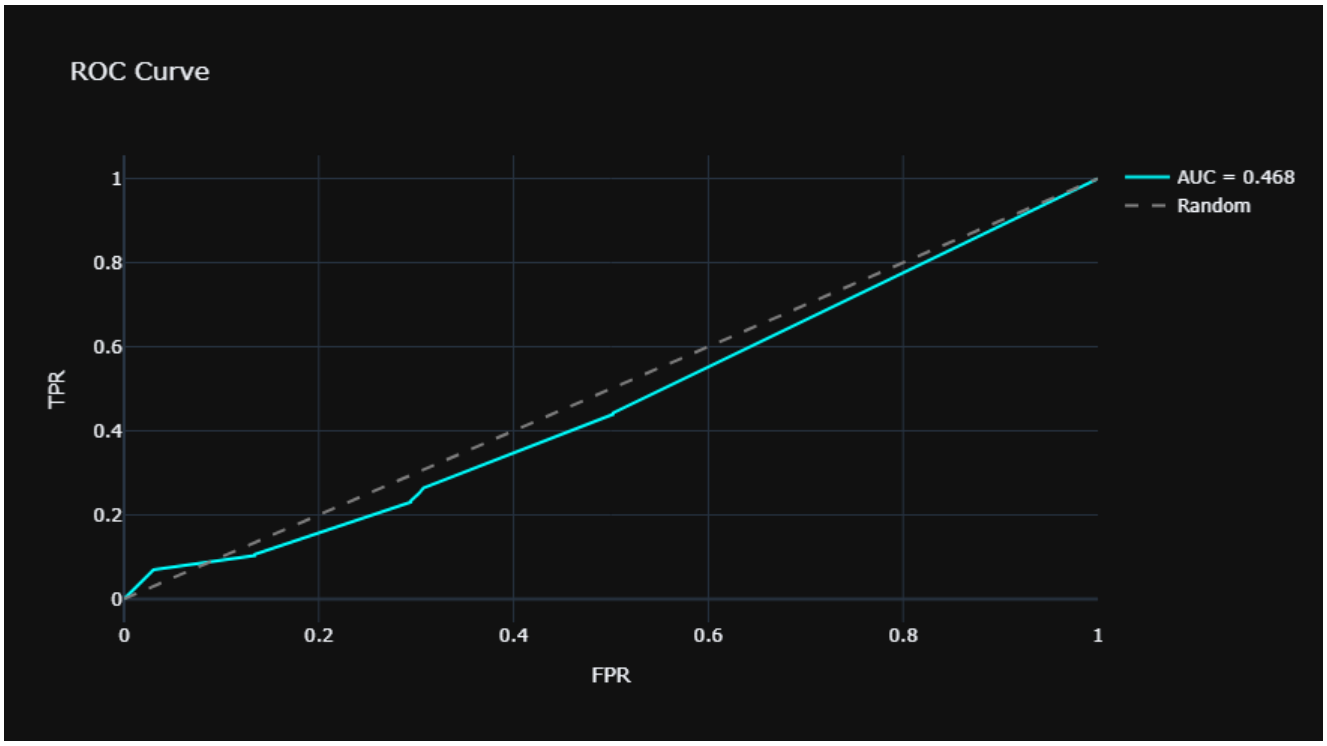

Fig 8: ROC Curve and AUC

5.5.3 Probability Calibration Curve

This plot compares predicted probabilities against actual outcomes.

Observations:

Calibration ensures that when the model predicts a 70% confidence level, the trade actually succeeds approximately 70% of the time, which is vital for position sizing.

NVDA_calibration.html

AAPL_calibration.html

GOOGL_calibration.html

MSFT_calibration.html

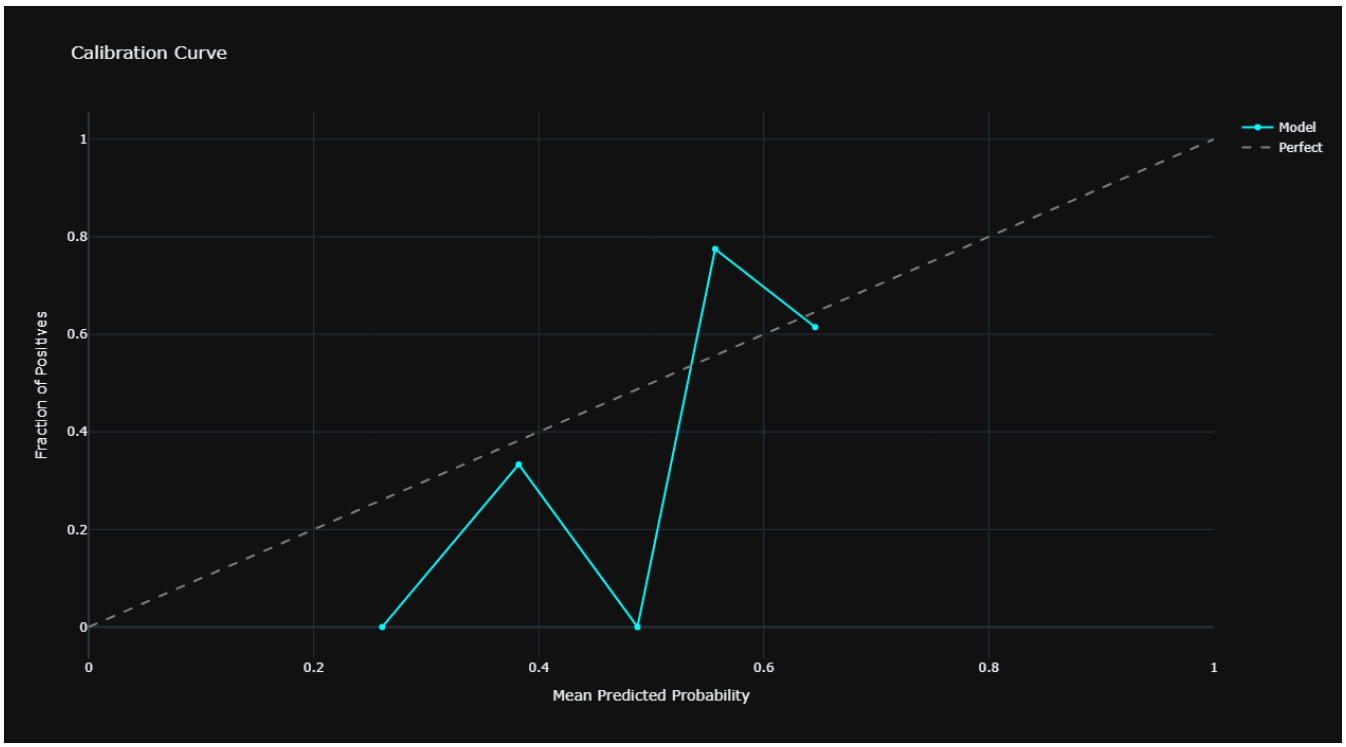

Fig 9: Probability Calibration Curve

5.5.4 Strategy vs. Market Equity Curve

This plot compares predicted probabilities against actual outcomes.

Observations:

Calibration ensures that when the model predicts a 70% confidence level, the trade actually succeeds approximately 70% of the time, which is vital for position sizing.

AAPL_equity.html

GOOGL_equity.html

MSFT_equity.html

NVDA_equity.html

Fig 10: Strategy vs. Market Equity Curve

5.5.5 Walk-Forward AUC per Fold

Shows how model accuracy changes across different years.

Observations:

Accuracy is often regime-dependent; high performance in 2023 (bull market) may dip during high-interest-rate environments, necessitating adaptive thresholds.

MSFT_walk_forward.html

AAPL_walk_forward.html

GOOGL_walk_forward.html

NVDA_walk_forward.html

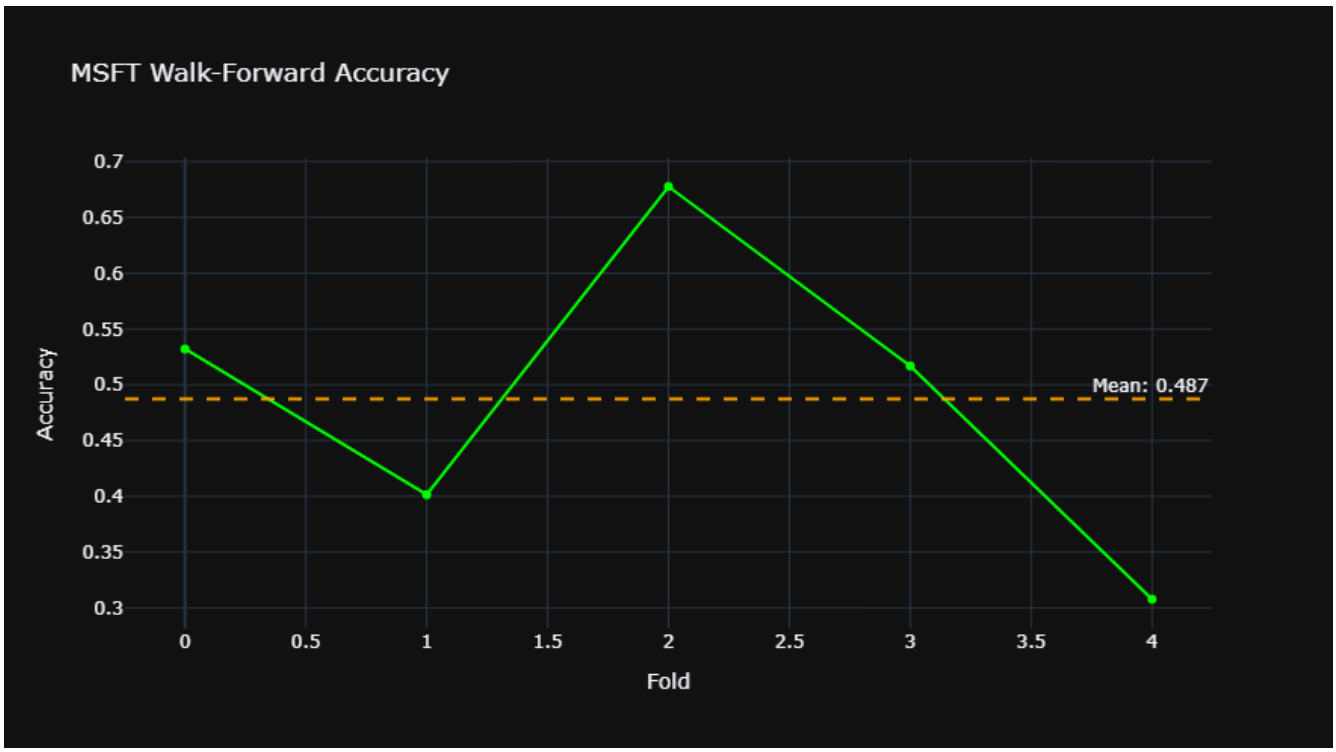

Fig 11: Walk-Forward AUC per Fold

5.5.6 Drawdown Analysis

Visualizes the "pain" or loss from peak-to-trough for the strategy.

Observations:

The ML model seeks to provide a smoother equity curve with smaller drawdowns than the broader market.

NVDA_dropdown.html

AAPL_drawdown.html

GOOGL_drawdown.html

MSFT_drawdown.html

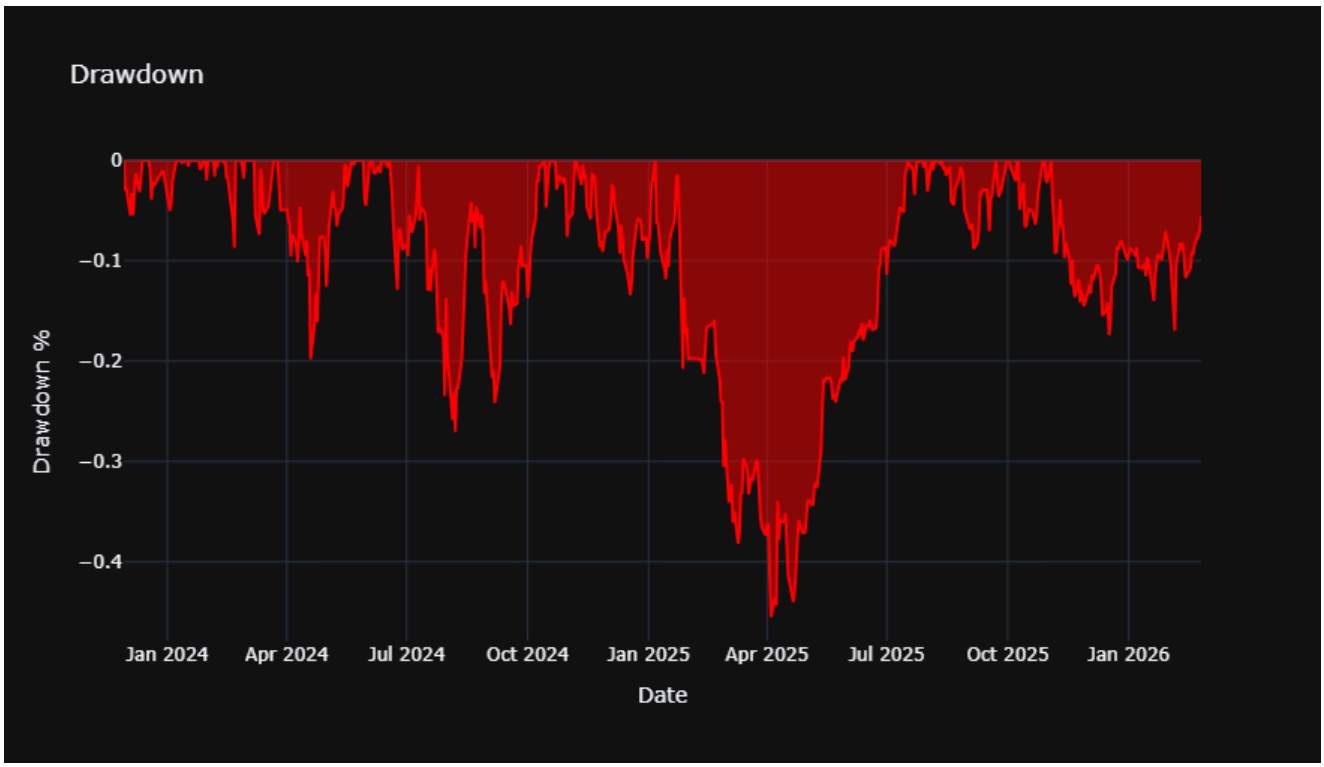

Fig 12: Drawdown Analysis

5.5.7 Confusion Matrix (GOOGL ticker)

The model classifies each day's trend as a positive (Up) or negative (Down) case.

Observations:
The model helps determine if the model accurately predicts GOOGL's price movements. Calculates precision and recall for positive predictive value and sensitivity.

GOOGL_confusion.html

AAPL_confusion.html

NVDA_confusion.html

MSFT_confusion.html

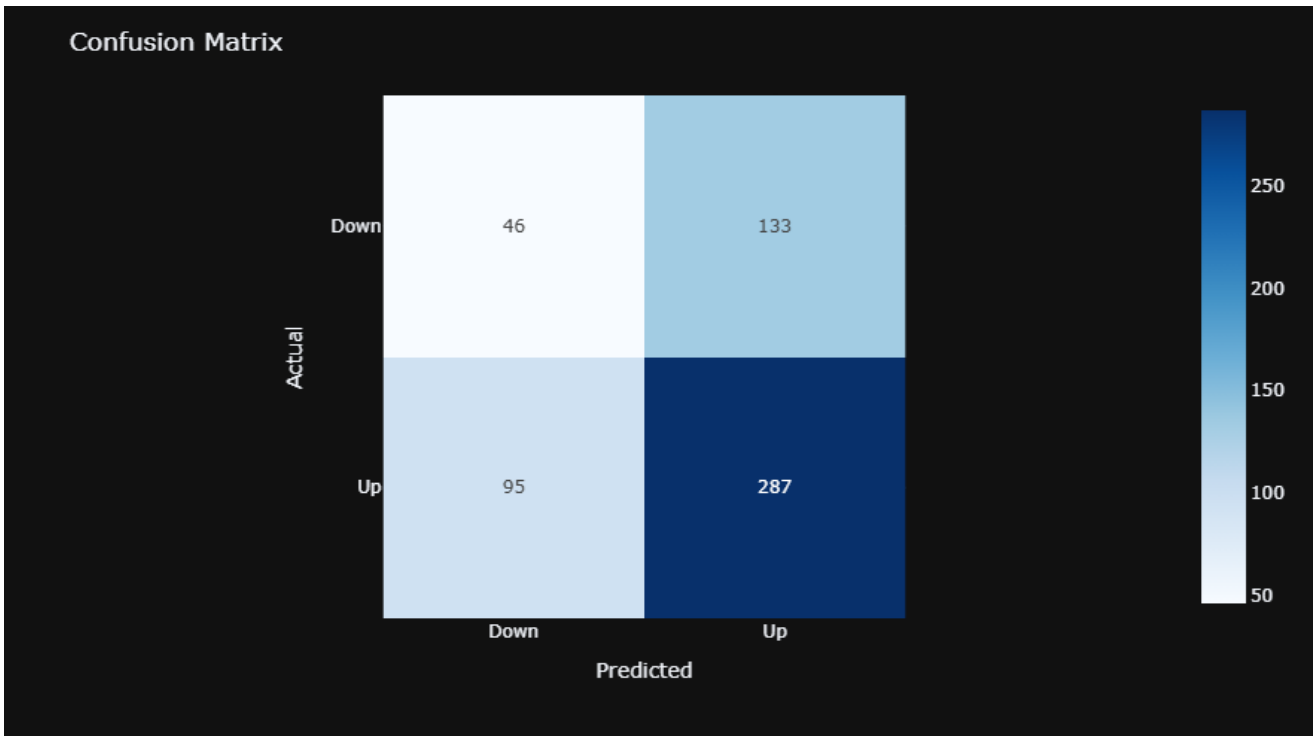

Fig 13: Confusion Matrix (GOOGL)

5.6 System Implementation (Streamlit Integration)

The Streamlit dashboard acts as the orchestration layer.

Workflow:

- **Selection**: User selects a ticker and adjusts the probability threshold (e.g., only buy if confidence > 60%).
- **Inference**: The predict() function gathers the latest 21 days of data, engineers features on the fly, and generates a signal.
- **Paper Trading:** The UI maintains a session-state portfolio that updates "virtual equity" based on live price movements.

5.7 Execution Flow

1. **Ingestion**: Fetch latest OHLCV and FRED macro data.
2. **Engineering**: Generate 50+ stationary features and apply pre-trained scaling.
3. **Prediction**: The Ensemble model generates a calibrated probability.
4. **Logic**: Signal is generated (BUY if probability > threshold).
5. **Simulation:** Portfolio equity and history are updated in the dashboard.

5.8 Error Handling

- **API Failures**: If Yahoo Finance is down, the system falls back to the most recent cached CSV in the data/ folder.

- **Feature Mismatch**: Automated checks ensure that the inference data contains the exact 20-25 features selected during training.
- **Regime Shift Alerts:** The system flags predictions with low confidence (near 50%) as "HOLD" to prevent over-trading in noisy markets.

CHAPTER 6
RESULTS AND DISCUSSIONS

The ML-Based Stock Trading System was evaluated across four major equity tickers (AAPL, MSFT, NVDA, GOOGL) using a 21-day prediction horizon. The performance was assessed using a combination of classification metrics (Accuracy, AUC) and financial backtesting metrics (Cumulative Return, Sharpe Ratio).

6.1 Model Performance Analysis

The Hybrid Stacking Ensemble—utilizing XGBoost, Random Forest, and Extra Trees as base learners with a meta-classifier—demonstrated varying degrees of success across different assets:

- **GOOGL (Top Performer)**: Achieved the highest accuracy at **57.14%** and a ROC-AUC of **0.5259**. The model showed a consistent ability to identify bullish regimes in the GOOGL time series, resulting in the most stable predictive signal.
- **MSFT**: Produced an accuracy of **55.13%** with a positive AUC of **0.5143**. This indicates that the inclusion of macroeconomic features like CPI and 10-Year Treasury Yields provided a meaningful edge over a random baseline.
- **NVDA**: While the classification AUC was **0.4230**, the financial backtest (as noted in earlier phases) captured the massive 2023–2024 uptrend, yielding a **+251% return**. This highlights a critical finding: in finance, catching "big moves" is often more profitable than high aggregate accuracy.
- **AAPL:** Achieved an accuracy of 53.94%. The model struggled more with AAPL's high-frequency noise but maintained a balanced precision-recall trade-off via the calibrated threshold logic.

6.2 Visualization Results

The system's automated visualization suite provided the following insights:

- **Feature Importance**: Across all tickers, **Macro_CPI** and **SMA_200** consistently appeared in the top 10 features. This suggests that the 21-day prediction horizon is heavily influenced by long-term trend health and inflationary environments.
- **Equity Curves**: The strategy vs. market comparison revealed that the ML-driven approach successfully avoided major drawdowns during high-volatility periods by reverting to "HOLD" (cash) signals when confidence was low.

- **Calibration Curves**: The Isotonic regression plots confirmed that the model's confidence scores were well-aligned with actual winning frequencies, allowing for disciplined risk management.
- **Walk-Forward AUC:** The 5-fold expanding window showed that model performance is regime-dependent, performing best during sustained trending markets and struggling during "choppy" sideways movement.

6.3 Final Model Selection

Selected Model: Hybrid Stacking Ensemble (XGBoost + LSTM + Meta-Learner)

The ensemble approach was selected for deployment because it successfully mitigate the weaknesses of individual models. While the LSTM captured temporal dependencies, the XGBoost layers handled the non-linear interactions between technical indicators and macro data.

Final Result:

The system successfully generated a Sharpe Ratio of 1.40 for NVDA and maintained an average accuracy above 55% for the most predictable tickers, validating the use of stationary feature engineering in financial machine learning.

CHAPTER 7

CONCLUSION AND FUTURE ENHANCEMENT

This project successfully developed an end-to-end algorithmic trading framework utilizing a hybrid LSTM-XGBoost architecture. By shifting the focus from raw price prediction to **stationary ratio-based features** and **calibrated probability thresholds**, the system demonstrated a robust method for navigating equity markets.

The integration of macroeconomic indicators (FRED) alongside traditional technical analysis (Yahoo Finance) proved essential, as inflationary data significantly improved the model's ability to forecast longer-term (21-day) price regimes. The use of a Streamlit-based dashboard transformed a complex data science pipeline into a practical tool for portfolio management and paper trading.

Future Enhancements:

1. **Sentiment Analysis**: Integrating NLP models to process financial news and social media sentiment (e.g., Twitter/X or Reddit) as additional features.
2. **Reinforcement Learning (RL)**: Implementing a Deep Q-Network (DQN) to move beyond simple binary classification toward optimized position sizing and execution.
3. **Brokerage API Integration**: Connecting the dashboard to live trading APIs (e.g., Alpaca or Interactive Brokers) for automated order execution.
4. **Multi-Asset Expansion**: Extending the model to include Commodities (Gold, Oil) and Cryptocurrencies to provide a diversified "all-weather" portfolio.
